SECTION A

ECONOMIC INDICATORS AND TRENDS

1. CROP ESTIMATES AND FORECASTS

Preliminary estimate of areas planted to summer field crops for the 2018 production season

The preliminary estimate of areas planted to summer crops for the 2018 production season was released by the Crop Estimates Committee (CEC) on 30 January 2018. Less favourable rainfall and warm temperatures in the western producing areas over the past few weeks prevented producers from planting their intended areas with summer crops, especially in the Free State and North West provinces.

The estimate for maize was 2,309 million ha, which is 12,2% less than the 2,629 million ha planted the previous season and 6,5% less than the intended plantings figure of 2,470 million ha released in October 2017.

The area estimate for white maize was 1,285 million ha, which represents a decrease of 21,8% from the 1,643 million ha planted for the 2017 season. In the case of yellow maize, the area estimate was 1,024 million ha, which is 4,0% more than the 985 500 ha planted for 2017.

The preliminary area estimate for sunflower seed was 560 100 ha, which is 11,9% less than the 635 750 ha planted the previous season. As some producers have not yet finished plantings, mainly because of unfavourable weather conditions, rainfall within the next weeks can still influence farmers' decisions to plant sunflower seed. It was also estimated that 701 000 ha had been planted to soya beans, which represents an increase of 22,1% from the 573 950 ha planted for the 2017 season.

For groundnuts, the area estimate was 53 000 ha, which is 5,4% less than the 56 000 ha planted the previous season. The area planted to sorghum decreased by an estimated 41,0%, from 42 350 ha to 25 000 ha. In the case of dry beans, the area estimate was 52 000 ha, which is 15,4% more than the 45 050 ha planted the previous season.

Preliminary estimate of areas planted to summer grain crops: 2018

Crop	Area planted 2018	Area planted 2017	Final crop 2017	Change in area 2018 *vs* 2017
	ha	ha	tons	%
White maize	1 284 700	1 643 100	9 916 000	-21,8
Yellow maize	1 024 500	985 500	6 904 000	+4,0
Maize	2 309 200	2 628 600	16 820 000	-12,2
Sunflower seed	560 100	635 750	874 000	-11,9
Soya beans	701 000	573 950	1 316 000	+22,1
Groundnuts	53 000	56 000	92 050	-5,4
Sorghum	25 000	42 350	152 000	-41,0
Dry beans	52 000	45 050	35 445	+15,4

Sixth production forecast for winter field crops for 2017

According to the sixth production forecast of winter crops, also released by the CEC on 30 January 2018, the expected wheat crop for 2017 was 1,475 million tons, which is 22,8% or 434 550 tons less than the 1,910 million tons of the previous season. The expected yield was 3,00 t/ha, compared to 3,76 t/ha the previous season. The area estimate for wheat was 491 600 ha, as against 508 365 ha for 2016—a decrease of 3,3%.

The main contributing provinces to the expected wheat crop were the Western Cape, with a production forecast of 586 800 tons (39,8%), followed by the Northern Cape with 304 000 tons (20,6%) and the Free State with 296 000 tons (20,1%). The expected yield for the Western Cape was 1,80 t/ha, which is 47,1% lower than the 3,40 t/ha of the previous season. The expected yield for the Northern Cape was 8,00 t/ha, compared to 7,60 t/ha the previous season—an increase of 5,3%. A yield of 3,70 t/ha was expected for the Free State, which is 32,1% higher than the 2,80 t/ha for 2016.

The production forecast for malting barley was 307 064 tons, which is 13,5% or 47 936 tons lower than the 355 000 tons of the previous season. The area planted was estimated at 91 380 ha and the expected yield was 3,36 t/ha.

The expected canola crop was 93 469 tons, while the area estimate was 84 000 ha, with an expected yield of 1,11 t/ha.

Estimated areas planted and sixth production forecast for winter cereals: 2017

Crop	Area planted 2017	Sixth forecast 2017	Area planted 2016	Final crop 2016	Change in production 2017 vs 2016
	ha	tons	ha	tons	%
Wheat	491 600	1 475 450	508 365	1 910 000	-22,8
Malting barley	91 380	307 064	88 695	355 000	-13,5
Canola	84 000	93 469	68 075	105 000	-11,0

2 ECONOMIC INDICATORS OF THE SOUTH AFRICAN AGRICULTURAL SECTOR

Indicator (at current prices)	Jan. to Dec. 2016	Jan. to Dec. 2017	% change
Total gross farming income (R million)	256 276	274 948	+7,3
Intermediate expenditure (R million)	133 243	141 959	+6,5
Total farming cost (R million)	168 061	179 138	+6,6
Net farming income (R million)	89 938	101 015	+12,3
Domestic terms of trade (2010 = 1)	1,16	1,07	-7,8

Gross income from major products at current prices

	Jan. to Dec. 2016	Jan. to Dec. 2017	Change
Field crops:	R million		%
Maize	28 388	29 378	+3,5
Wheat	6 660	5 833	-12,4
Sugar cane	7 570	8 364	+10,5
Sunflower seed	4 752	3 979	-16,3
Tobacco	577	604	+4,7
All field crops	58 414	61 897	+6,0
Horticulture:			
Vegetables (including potatoes)	23 405	20 431	-12,7
Deciduous and other fruit	20 778	19 047	-8,3
Citrus fruit	18 019	19 223	+6,7
Viticulture	5 030	5 101	+1,4
Subtropical fruit	4 174	3 778	-9,5
All horticultural products	78 391	75 162	-4,1
Animal products:			
Poultry meat	36 670	44 847	+22,3
Cattle and calves slaughtered	31 981	36 618	+14,5
Milk	15 806	17 471	+10,5
Eggs	10 192	10 766	+5,6
Sheep slaughtered	6 577	7 495	+14,0
All animal products	119 472	137 889	+15,4

3. ECONOMIC OVERVIEW

This article gives an overview of the major macroeconomic trends in the agricultural sector for the period 1 January to 31 December 2017. Aggregates are compared with the period 1 January to 31 December 2016.

Gross farming income

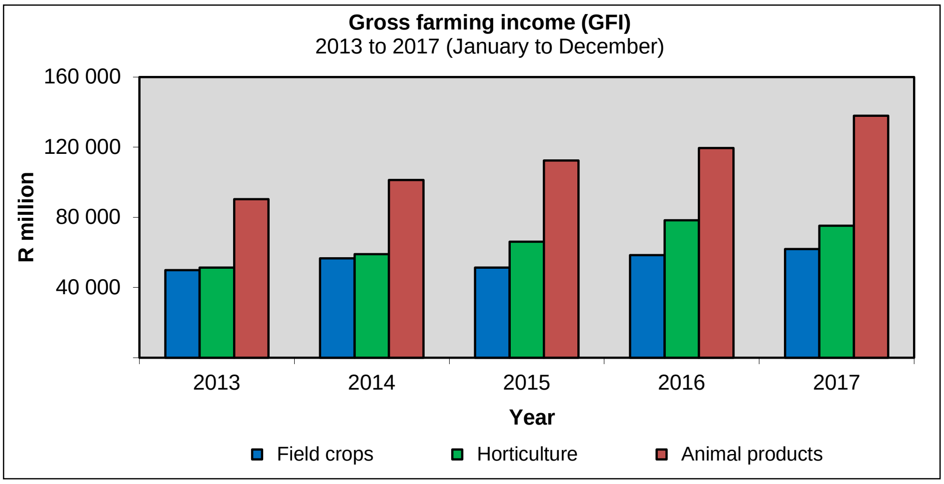
Gross farming income refers to both the part of agricultural production that is marketed and production for own consumption, valued at basic prices.

Gross income derived from all agricultural products for the period ended 31 December 2017 showed an increase of 7,3% and was estimated at R274 948 million. The main contributors were the increase in income which was obtained from animal products (15,4%) and field crops (6,0%). The income from horticultural products showed a decline of 4,1%.

The increase of 6,0% in income from field crops was the result of the substantial increase in income from groundnuts by 411,5%, dry beans (101,5%), grain sorghum (66,9%), cotton (40,2%), soya beans (36,1%), sugar cane (10,5%), hay (7,6%), tobacco (4,7%) and maize (3,5%).

The products that contributed to a decline in income from horticultural products by 4,1% were mainly vegetables by 12,7%, subtropical fruit (9,5%) and deciduous and other fruit (8,3%).

The 15,4% increase in income derived from animal products was caused by the increase in income from poultry meat by 22,3%, cattle and calves slaughtered (14,5%), sheep slaughtered (14,0%), milk (10,5%) and eggs (5,6%).



Expenditure on intermediate production inputs

Expenditure on intermediate production inputs refers to the value of the goods and services that were purchased to be consumed as inputs during the production process.

The expenditure on intermediate goods and services increased by 6,5% and was estimated at R141 959 million, compared to R133 243 million the previous period. This was mainly caused by the increase in expenditure on seed and plants by 10,0%, building and fencing material by 8,9%, packing material by 8,8%, farm feeds by 8,0%, animal health and crop protection and farm services by 6,0% each, fuel by 5,2%, maintenance and repairs of machinery and implements by 4,9% and fertilisers by 3,0%.

Farm feeds remained the largest expenditure item and constituted about 29,4% to overall expenditure, followed by maintenance and repairs of machinery and implements (13,6%), farm services (12,2%), fuel (8,8)%, seed and plants (6,7%), animal health and crop protection (6,2%), fertilisers (4,9%), packing material (4,8%) and building and fencing material (4,0%).

Prices received and paid by farmers as well as terms of trade

The prices received by farmers for their products decreased by an average of 2,9% for the period ended 31 December 2017. This was mainly caused by the decline in prices of field crops by 30,3% and horticultural products by 5,5%.

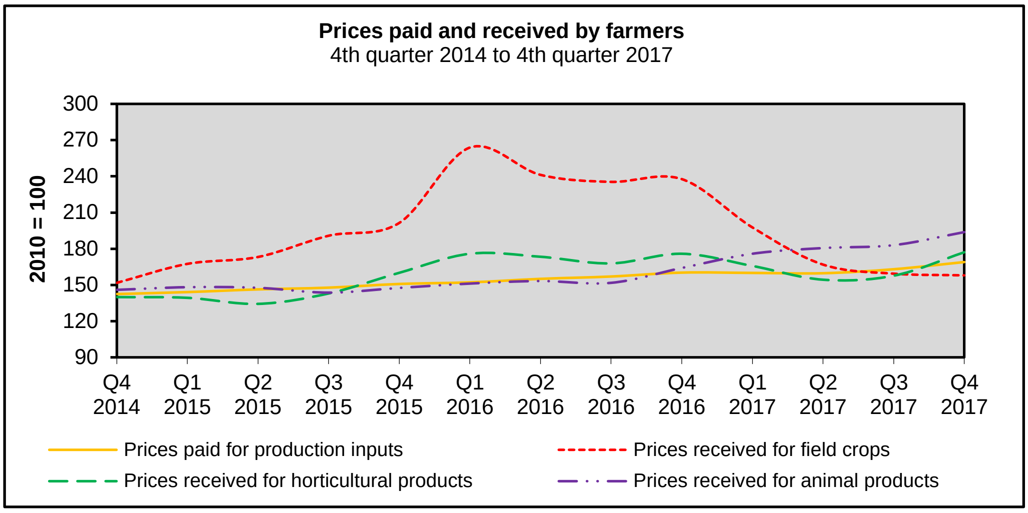
A substantial decline of 30,3% in field crops was the result of the decrease in summer grains by 45,4%, oilseeds by 22,6%, hay by 6,8%, winter grains by 6,7% and cotton by 4,1%. The prices of tobacco, dry beans and sugar cane increased by 12,9%, 3,4% and 1,6%, respectively.

A decrease of 5,5% in prices of horticultural products was mainly because of the decrease in prices of vegetables by 14,9% and fruit by 1,0%. Prices of viticulture increased by 4,0%.

The prices of animal products increased on average by 18,2% and was caused by the increase in prices of slaughtered stock by 20,7%, poultry meat by 19,8%, pastoral products by 10,2% and milk by 8,8%.

The prices paid for farming requisites, including machinery and implements, material for fixed improvements as well as intermediate goods, increased by 4,3%, compared to 6,0% the previous year. The prices paid for animal health and crop protection increased by 8,9%, packing material by 7,8%, trucks by 6,0%, seeds by 5,3%, fencing material by 5,1%, maintenance and repairs of machinery and implements by 4,6%, building material and fertilisers by 4,0% each, tractors by 3,4%, feeds by 3,1% and fuel by 2,7%.

The terms of trade declined by 7,8%, due to the increase of 6,5% in production costs and a decrease of 2,9% in prices received by the farmers for their products.



Net farming income and cash flow

The gross farming income and expenditure on production inputs increased by 7,3% and 6,5%, respectively, which led to the increase of 12,3% in net farming income. Interest payment increased by 10,4%, while labour costs and rent payment increased by 5,3% each.

The cash flow realised by the farmers was estimated at R103 639 million for the period under review, compared to R95 563 million of the previous period, which is an increase of 8,5%.

Conclusion

The increase in gross farming income was mainly caused by the increase in income derived from animal products (15,4%) and field crops (6,0%). The increase in income from animal products was the result of the increase in prices of animal products, while that from field crops was caused by the substantial increase in production levels. The products that contributed to the increase in production levels of field crops included groundnuts (420,6%), grain sorghum (114,7%), maize (115,3% seasonally), dry beans (92,3%), soya beans (74,4% seasonally), cotton (53,8%), sunflower seed (15,8%), sugar cane (11,4%) and hay (7,7%).

On the other hand, the increase in production of most horticultural products such as citrus fruit (9,8%), vegetables (3,6%), viticulture (1,4%) and deciduous and other fruit (0,3%), did not have positive impact on the income derived from these products, due to the decrease in prices.

SECTION B

FRESH PRODUCE MARKETS OVERVIEW

FRESH MARKET STATISTICS AND GRAPHIC PRESENTATION OF SEASONAL FLUCTUATIONS IN QUANTITIES AND PRICES OF FRUIT AND VEGETABLES SOLD ON THE MAJOR FRESH PRODUCE MARKETS

The purpose of this overview is to show the short-term price and volume trends (seasonal fluctuations) of various types of fruit and vegetables sold on major fresh produce markets and to make comparisons between the markets.

Market prices are determined by the interaction between supply and demand, which is influenced by various factors. Supply factors include climate, seasonal production, perishability of products and producers' reaction to prices realised in preceding periods, etc. Demand factors include consumer preferences, substitution between products and per capita income. Therefore, the seasonal pattern of quantities sold and prices realised may differ considerably among the various markets.

The graphs in this overview depict the trends for fruit and vegetables sold on the East London Fresh Produce Market and give an indication of the variations in monthly volumes sold and prices received, based on the average for the five-year period 2013 to 2017.

Detailed information regarding the specific varieties of fruit and vegetables sold on the markets is available on request from:

Interesting Herb: Turmeric

Scientific name: *Curcuma longa*

Common names: Turmeric

Other names: Kasturi Manjal, Curcuma, Turmeric Root, Yu Jin, Safran Bourbon, Indian Saffron, Pian Jiang Huang

History: Turmeric is best known for that bold yellow-orange colour that it gives to curry. Turmeric has been in use in Asia for thousands of years. History shows that by 800 AD, the cultivation and trade of turmeric had spread across much of Asia, including China and also across much of Africa. By the 18th century, as it continued to become increasingly popular, turmeric spread to Jamaica and other tropical locations. Today, it can also be found in Hawaii and Costa Rica.

Turmeric has a special place in Indian tradition and worship too. It is used to worship the Sun God. It is also worn by people as a part of purification processes.

The usage of turmeric in India is very old and its usage is documented in various forms. It was used as a beauty aid, spice and as a medicine—an all in one herb with amazing properties. It is therefore not surprising that turmeric has such a place in ancient Indian medical science.

Description: Turmeric comes from the root of the *Curcuma longa* plant which is a perennial plant that is part of the ginger family. This plant is native to India and requires warm, tropical climates and lots of rain to grow and thrive. The plant has a tough brown skin and a very rich orange pulp.

Turmeric is a perennial herbaceous plant that grows up to 1 m high. Highly branched, yellow to orange, cylindrical, aromatic rhizomes are found. The leaves are alternate and arranged in two rows. They are divided into leaf sheath, petiole and leaf blade. From the leaf sheaths, a false stem is formed. The petiole is 50 to 115 cm long. The simple leaf blades are usually 76 to 115 cm long and rarely up to 230 cm. They have a width of 38 to 45 cm and are oblong to elliptic, narrowing at the tip.

At the top of the inflorescence, stem bracts are present on which no flowers occur; these are white to green and sometimes, tinged reddish-purple and the upper ends are tapered.

The hermaphrodite flowers are zygomorphic and threefold. They are 0,8 to 1,2 cm long and sepals are fused, white, have fluffy hairs and the three calyx teeth are unequal. The three bright-yellow petals are fused into a corolla tube up to 3 cm long. The three corolla lobes have a length of 1,0 to 1,5 cm and are triangular with soft-spiny upper ends.

While the average corolla lobe is larger than the two laterals, only the median stamen of the inner circle is fertile. The dust bag is spurred at its base. All other stamens are converted to staminodes. The outer staminodes are shorter than the labellum. The labellum is yellowish, with a yellow ribbon in its centre and it is obovate, with a length of 1,2 to 2,0 cm. Three carpels are under a constant, trilobed ovary adherent, which is sparsely hairy. The fruit capsule opens with three compartments.

Cultivation: The turmeric plant is planted in the months of September to October. It grows in light black, black clayey loams and red soils in irrigated and rain fed conditions. The rhizomes are planted 5 to 7 cm deep. This crop is planted by the small rhizomes with one or two buds. It is harvested after 9 to10 months of planting. The lower leaves turn yellow and fall off with age.

Health Benefits:

Largely due to its curcumin content, turmeric is often credited with these benefits:

Turmeric dramatically increases the antioxidant capacity of the body: The main reason antioxidants are so beneficial, is that they protect our bodies from free radicals.

Curcumin boosts brain-derived neurotrophic factor, linked to improved brain function and a lower risk of brain diseases

Turmeric contains bioactive compounds with powerful medicinal properties: These compounds are called curcuminoids, the most important of which is curcumin.

Curcumin is the main active ingredient in turmeric. It has powerful anti-inflammatory effects and is a very strong antioxidant.

Turmeric can help prevent (and perhaps even treat) cancer: studies have shown that it can reduce angiogenesis (growth of new blood vessels in tumours), metastasis (spread of cancer), as well as contributing to the death of cancerous cells.

Culinary uses: Whether chopped, sliced, grated or ground, turmeric provides bright colour and imparts a robust, peppery flavour and aroma with a hint of aged wood. It provides the characteristic golden colour of curries and dhal, a type of stew made from hulled, split lentils or peas.

Turmeric is one of the key ingredients in many Asian dishes, imparting a mustard-like, earthy aroma and pungent, slightly bitter flavour to foods. Turmeric is used mostly in savoury dishes, but also is used in some sweet dishes, such as the cake, sfouf.

In India, turmeric plant leaf is used to prepare special sweet dishes, such as Patoleo, by layering rice flour and coconut-jiggery mixture on the leaf, then closing and steaming it in a special utensil Most turmeric is used in the form of rhizome powder to impart a golden yellow colour.

External uses: The powered rhizome of this plant is used as a condiment and as a yellow dye. It is used to colour and flavour foodstuff. It is used in the preparation of medicinal oils, ointments and poultices. It is even used in cosmetics.
